Abstract of the Disclosure:

A shelf storage facility 1 comprises shelf bays 35 including a V-shaped channel as shelf 41. A product support 42, which has equally the shape of a V-shaped channel, rests in each channel 34. The storage and retrieval device 4, which is used for storing and retrieving the products 48, carries, on its part, a V-shaped channel 64 on the upper side, on which either the product support 42 with the products 48 or a product 48 along, which is to be distributed, can be deposited. By means of an actuating finger 74, which can be pivoted upwards through a gap 65 in the channel 64 of the storage and retrieval device 4, it is possible to displace the product support 42 or the package 48 loosely resting on the storage and retrieval device without a product.
